Assignment 2: Employee Registration and Document Upload System

Course: PHP Web Development
Chapters: Chapter 3 (PHP Functions) and Chapter 4 (Forms, Validation and File Uploading)
Duration: 2 Hours
Total Marks: 5
Assignment Type: Individual Practical Assignment

Assignment Objective

Develop an Employee Registration and Document Upload System using HTML and PHP.

The system must allow users to enter employee information, upload a document, calculate employee salary using PHP functions, and display the information and calculated results in an HTML table.

Task 1: Create Employee Registration Form

Create an HTML file named index.html containing the following fields:

Field	Input Type
Employee Full Name	Text
Employee ID	Text
Gender	Radio Button
Department	Drop-down List
Basic Salary	Number
Allowance	Number
Deduction	Number
Employee Document	File Upload

The department options must include:

- Human Resources
- Finance
- Information Technology
- Administration

Requirements:

1. Use the POST method to submit information.
2. Use enctype="multipart/form-data" to support document uploading.
3. Add a **Register and Calculate** button.
4. Add a **Reset** button.
5. Submit the information to process.php.

Task 2: Create PHP Functions (20 Marks)

Create a PHP file named functions.php.

Define the following functions:

1. calculateGrossSalary() accepts basic salary and allowance, then returns the gross salary.
2. calculateNetSalary() accepts gross salary and deduction, then returns the net salary.
3. calculateBonus() accepts basic salary and returns the employee bonus based on the rules below.
4. checkSalaryStatus() accepts net salary and returns the salary category.

Bonus calculation rules:

Basic Salary	Bonus
1,000 or above	10% of Basic Salary
500–999.99	5% of Basic Salary
Below 500	No Bonus

Salary status rules:

Net Salary	Status
1,500 or above	High Salary
800–1499.99	Medium Salary
Below 800	Low Salary

Use the following formulas:

- Gross Salary = Basic Salary + Allowance
- Net Salary = Gross Salary + Bonus − Deduction

The net salary calculation must include the calculated bonus.

Each function must accept the necessary parameters and return a value.

Task 3: Process and Validate Employee Information (20 Marks)

Create a PHP file named process.php.

Use $_POST to retrieve submitted information.

Apply the following validation rules:

1. Employee Full Name must not be empty.
2. Employee ID must not be empty.
3. Gender must be selected.
4. Department must be selected.
5. Basic Salary must be entered and greater than zero.
6. Allowance must be entered and cannot be negative.
7. Deduction must be entered and cannot be negative.
8. Deduction must not exceed Gross Salary plus Bonus.
9. An employee document must be selected.

Display an appropriate error message when validation fails.

Use the PHP concepts covered in the lectures, including isset(), empty(), and conditional statements.

Task 4: Upload Employee Document

Create a folder named uploads to store employee documents.

Implement the following features:

1. Allow the user to upload one employee document.
2. Retrieve the uploaded document information using $_FILES.
3. Check whether the document was submitted successfully.
4. Reject files larger than 2 MB.
5. Check whether a document with the same name already exists using file_exists().
6. Use move_uploaded_file() to save the document in the uploads folder.
7. Display a success message when the document is uploaded.
8. Display an appropriate error message if the upload fails.
9. Do not overwrite an existing document.

Task 5: Display Employee Information and Salary Results

After successful validation and document uploading, display the employee information and salary calculations in an HTML table.

The table must contain:

1. Employee Full Name
2. Employee ID
3. Gender
4. Department
5. Basic Salary
6. Allowance
7. Gross Salary
8. Bonus
9. Deduction
10. Net Salary
11. Salary Status
12. Uploaded Document Name
13. File Type
14. File Size
15. Upload Status

Use require_once to include the PHP functions from functions.php.

General Instructions

1. Complete the assignment individually.
2. Use HTML and PHP.
3. Keep the HTML form and PHP processing code in separate files.
4. Do not create arrays or use array-processing loops.
5. Include comments explaining important sections of your code.
6. Use an HTML table to display the final results.
7. Test the application using XAMPP.

Required Project Structure

Employee_Registration_System/

├── index.html

├── functions.php

├── process.php

└── uploads/

Submission Requirements

Submit the following:

1. The complete **Employee_Registration_System** folder.
2. All three-source code files.
3. The uploads folder contains one sample document.
4. Screenshot of the employee registration form.
5. Screenshot of the calculated salary results.
6. Screenshot showing the successful document upload.
7. Screenshot showing at least one validation error.

Marking Scheme

Assessment Criteria	Marks
Employee Registration Form	20
PHP Functions	20
Form Processing and Validation	20
Document Uploading	25
Displaying Employee and Salary Results	15
Total	**100**
